Access to many of today's expensive, life-changing medicines remains a hurdle for countless Americans. Helping overcome these barriers to good health and wellness is what drives each and every one of us who work at Dr. Reddy's North American Generics.

Each day, we strive to do what matters most to patients, determined to find the best way to answer their unmet and under-met needs innovatively and with agility.

Our 5 promises:

- We bring expensive medicine within reach
- We address unmet patient needs

- We work with partners to help them succeed

Uncovering new opportunities for good health has helped us build one of the most expansive offerings in the industry and bring value to the pharmacy and its customers.

Dr. Reddy's products span across major therapeutic categories including gastrointestinal, cardiovascular, pain management, oncology, anti-infectives, pediatrics, and dermatology. More than 80 prescription products are marketed under the Dr. Reddy's label in over 350 dosing presentations, supported by an aggressive product pipeline.

One reason that we're able to make our medicines affordable is because we manage the entire value chain – from producing the active ingredients to developing formulations to distributing them through our streamlined supply chain.

Dr. Reddy's manufacturing facilities follow cGMP guidelines in the production of API's and finished dosage forms. Five finished dosage facilities and 8 API facilities currently serve North American Generics. The strategic benefits of vertical integration help ensure that Dr. Reddy's products are delivered on time.

The need for good health continues to propel our business strategies at Dr. Reddy's. We are in the business of facilitating good health – driven by a companywide imperative to accelerate access to affordable and innovative medicines to people who need them. With this conviction, we continue to invest in product development, acquisitions, and advances in research, processes, and technologies that help us deliver on our promise. We don't see medicines as just molecules, but as tools that will help people get back to health and promote wellness among them.

As we look ahead, we're committed to meet the needs of consumers by resolving challenges. Our goal is to make good health possible.

ISMP's List of Error-Prone Abbreviations, Symbols, and Dose Designations

The abbreviations, symbols, and dose designations found in this table have been reported to ISMP through the ISMP National Medication Errors Reporting Program (ISMP MERP) as being frequently misinterpreted and involved in harmful medication errors. They should **NEVER** be used when communicating medical information. This includes internal communications, telephone/verbal prescriptions, computer-generated labels, labels for drug storage bins, medication administration records, as well as pharmacy and prescriber computer order entry screens.

CREATININE CLEARANCE FORMULA

Measuring creatinine clearance using serum concentration level and timed urine collection provides an estimate of glomerular filtration rate (GFR):

$$\text{Creatinine Clearance (CICr)} = \frac{\text{urine creatinine} \times \text{volume}}{\text{serum creatinine}}$$

COCKCROFT-GAULT EQUATION

The estimated creatinine clearance rate using Cockcroft-Gault equation is as follows:

$$\text{CICr}_{\text{(est)}} \text{ (mL/min)} = \frac{[140 - \text{age (yrs)}] \times \text{weight (kilograms)} \times 0.85 \text{ if female}}{72 \times \text{serum creatinine (mg/dL)}}$$

MODIFICATION OF DIET ON RENAL DISEASE (MDRD) STUDY EQUATION

The original MDRD Study Equation – suitable for use with creatinine methods that DO NOT have calibration traceable to isotope dilution mass spectrometry (IDMS):

$$\text{GFR}_{\text{(est)}} \text{ (mL/min per } 1.73 \text{ m}^2\text{)} = 186 \times [\text{serum creatinine (mg/dL)}]^{-1.154} \times [\text{age (yrs)}]^{-0.203} \times (0.742 \text{ if female}) \times (1.212 \text{ if African American})$$

The MDRD Study Equation – re-expressed for use with standardized serum creatinine levels:

$$\text{GFR}_{\text{(est)}} \text{ (mL/min per } 1.73 \text{ m}^2\text{)} = 175 \times [\text{standardized serum creatinine (mg/dL)}]^{-1.154} \times [\text{age (yrs)}]^{-0.203} \times (0.742 \text{ if female}) \times (1.212 \text{ if African American})$$

THE MOSTELLER FORMULA

$$\text{BSA (m}^2\text{)} = ([\text{Height (cm)} \times \text{Weight (kg)}] / 3600)^{0.725}$$

THE DUBOIS AND DUBOIS FORMULA

THE HAYCOCK FORMULA

$$\text{BSA (m}^2\text{)} = 0.024265 \times \text{Height (cm)}^{0.3964} \times \text{Weight (kg)}^{0.5378}$$

INSTITUTE FOR SAFE MEDICATION PRACTICES (ISMP) LIST OF HIGH-ALERT MEDICATIONS IN ACUTE CARE SETTINGS

High-alert medications are drugs that bear a heightened risk of causing significant patient harm when they are used in error. Although mistakes may or may not be more common with these drugs, the consequences of an error are clearly more devastating to patients. We hope you will use this list to determine which medications require special safeguards to reduce the risk of errors. This may include strategies such as standardizing the ordering, storage, preparation, and administration of these products; improving access to information about these drugs; limiting access to high-alert medications; using auxiliary labels; employing clinical decision support and automated alerts; and using redundancies such as automated or independent double-checks when necessary. (Note: manual independent double-checks are not always the optimal error-reduction strategy and may not be practical for all of the medications on the list).

CLASSES/CATEGORIES OF MEDICATIONS

adrenergic agonists, IV (e.g., **EPINEPH**rine, phenylephrine, norepinephrine)

adrenergic antagonists, IV (e.g., propranolol, metoprolol, labetalol)

anesthetic agents, general, inhaled and IV (e.g., propofol, ketamine)

antiarrhythmics, IV (e.g., lidocaine, amiodarone)

antithrombotic agents, including:

- anticoagulants (e.g., warfarin, low molecular weight heparin, unfractionated heparin)
- direct thrombin inhibitors (e.g., argatroban, bivalirudin, dabigatran)
- glycoprotein IIb/IIIa inhibitors (e.g., eptifibatide)
- thrombolytics (e.g., alteplase, reteplase, tenecteplase)

BACKGROUND

Based on error reports submitted to the ISMP National Medication Errors Reporting Program (ISMP MERP), reports of harmful errors in the literature, studies that identify the drugs most often involved in harmful errors, and input from practitioners and safety experts, ISMP created and periodically updates a list of potential high-alert medications. During June and July 2018, practitioners responded to an ISMP survey designed to identify which medications were most frequently considered high-alert. Further, to assure relevance and completeness, the clinical staff at ISMP and members of the ISMP advisory board, were asked to review the potential list. This list of medications and medication categories reflects the collective thinking of all who provided input.
